- **Statistical Sampling:** This technique uses statistical theory to determine an appropriate sample size and select items from the population based on random sampling.
- **Non-statistical Sampling:** In non-statistical sampling, auditors use their judgment to select items for testing, considering factors such as risk, materiality, and knowledge of the entity.
- **Attribute Sampling:** Attribute sampling is used to estimate the rate of occurrence of a certain characteristic within a population. It is particularly useful for testing compliance with controls.
- **Variable Sampling:** Variable sampling is employed to estimate the monetary value of a population or assess the reasonableness of an account balance.

These techniques, along with others outlined in the AICPA Audit Guide, empower auditors to tailor their sampling approach according to the unique characteristics and requirements of each audit engagement.
